this book contains an explanatory treatment of the core areas of difficulty for the english speaking learner of french it deals with the key issues in tense formation and use and verbal structures and processes such as negation passives and subjunctives along with a highly exemplified treatment of pronouns and a section dealing with adjectives and other elements of the grammar it fills a gap between general text books of french in which grammatical issues are frequently treated piecemeal and scattered throughout the book in between more communicative information on one hand and exhaustive reference grammars aimed at graduate and research students on the other which would be beyond the level of intellectual maturity of most school children and some non specialist undergraduates it has the advantage of treating each grammatical issue in detail but without being too long winded explaining the systems and processes which underlie the facts of the language the emphasis is on explanation and not merely the listing of facts enabling the learner to master the system and become an independent user of the language it could be used highly successfully either as a classroom aid alongside the more usual textbooks which are organized typically

around topics and themes in society or for self study for the committed individual learner of any age there are extensive exercises and answers for all topics covered

the notion of focus structure in this work refers to the distinction between categorical thetic and identificational sentences the central claim is that the syntactic representation of every sentence has to encode which of these types of focus structure is realized this claim is discussed in great detail with respect to syntax intonation and semantics within the framework of the minimalist program it is shown that the incorporation of focus structure into syntax offers new perspectives for a solution of vexing problems in syntax and semantics for example fronting preposing topicalisation is treated as a syntactic operation which clearly belongs to core grammar i e is not optional or stylistic the semantic notion of quantifier raising is dispensed with in favour of a focus structural treatment of phenomena which gave rise to it the book appeals to generative linguists and to functional linguists who do not believe in an unbridgeable gap between the formal and functional analysis of language

this volume emphasizes a new line of thinking in generative grammar which acknowledges that certain synchronic properties of languages can only be fully understood if diachronic data is taken into consideration the central topics addressed in this collection of papers are 1 a critical assessment of the hypothesis that certain apparently synchronic generalizations are actually the result of the mechanisms of language change 2 an inquiry into how diachronic data can be used to evaluate and shape formal analyses of particular synchronic phenomena reviving the interest in diachronic explanations for synchronic data the contributions provide novel and original diachronic accounts of phenomena that up to now have escaped a deeper synchronic explanation including the nature of epp features gaps in the distribution of complementizer agreement and counterexamples to the generalization that rich verbal inflection correlates with verb movement

the claim that pronominals have phonological features only where they must for some reason is strongly supported by the occurrence of the null pronoun pro as coined and introduced by noam chomsky how reference of pro is determined is the main subject of control theory the subsystem of core grammar to which this study is dedicated chomsky has not followed up his natural suggestion that choice of controller is determined by theta roles or other semantic properties of the verb perhaps pragmatic conditions of some sort but then a great many students of control have engaged in exploring thematic roles as tools most suitable for investigating control shifting analysis of control to the relationship between thematic features carried by pro and its potential controller respectively was a

turning point in control theory control proved to be a by product of satisfying matching conditions that exist between thematic properties of pro and its licit controller the constraints derived from them are not construction specific if grammar and pragmatics seem to go hand in hand their complicity in determining control behavior is elucidated by showing that pragmatic factors can be referred to by grammatical constraints data of nine languages are used in the study

this book investigates the architecture of the language faculty by considering what the properties of language reveal about the mental abilities and processes involved in language acquisition the language faculty the author argues must be able not only to accommodate what is general exceptionless and universal in language but must also be capable of dealing with what is irregular exceptional and idiosyncratic in syntactic nuts peter culicover shows that this is true not only of the lexicon but for syntax marginal and exceptional cases where there is no straightforward form meaning correspondence are dealt with by the language faculty easily and precisely as the general cases in considering how and why this should be the author argues against the prevailing trend in generative grammar whichtakes the learner as either incorporating maximally global generalisations as part of its innate capacity for language or projecting global

generalisations from a very limited input on the basis of innate mechanisms he suggests that the learning mechanism does not generalize significantly beyondthe evidence presented to it and further that it seeks to form generalizations based on all and only the evidence presented to it syntactic nuts makes a fundamental contribution to generative grammar and syntactic theory it situates syntactic theory within cognitive science in a novel way it contributes to an alternative and yet in many ways traditional perspective on the manner in which knowledge is represented andprocessed in the mind

this grammar provides the first comprehensive grammatical description of moloko a chadic language spoken by about 10 000 speakers in northern cameroon the grammar was developed from hours and years that the authors spent at friends houses hearing and recording stories hours spent listening to the tapes and transcribing the stories then translating them and studying the language through them time was spent together and with others speaking the language and talking about it translating resources and talking to moloko people about

them grammar and phonology discoveries were made in the office in the fields while working and at gatherings in the process the four authors have become more and more passionate about the moloko language and are eager to share their knowledge about it with others intriguing phonological aspects of moloko include the fact that words have a consonantal skeleton and only one underlying vowel but with ten phonetic variants the simplicity of the vowel system contrasts with the complexity of the verb word which can include information in addition to the verbal idea about subject direct object semantic theme indirect object recipient or beneficiary direction location aspect imperfective and perfective mood indicative irrealis iterative and perfect aspect some of the fascinating aspects about the grammar of moloko include transitivity issues question formation presupposition and the absence of simple adjectives as a grammatical class most verbs are not inherently transitive or intransitive but rather the semantics is tied to the number and type of core grammatical relations in a clause morphologically two types of verb pronominals indicate two kinds of direct object both are found in ditransitive clauses noun incorporation of special body part nouns in some verbs adds another grammatical argument and changes the lexical characteristics of the verb clauses of zero transitivity can occur in main clauses due to the use of dependent verb forms and ideophones question formation is interesting in that the interrogative pronoun is clause final for most constructions the clause will sometimes be reconfigured so that the interrogative pronoun can be clause final expectation is a foundational pillar for moloko grammar three types of irrealis mood relate to speaker s expectation concerning the accomplishment of an event clauses are organised around the concept of presupposition through the use of the na construction known or expected elements are marked with the na particle there are no simple adjectives in moloko all adjectives are derived from nouns the authors invite others to further explore the intricacies of the phonology and grammar of this intriguing language

battistella traces the development of markedness theory as a central part of structuralist theories of language he outlines the concepts of marked and unmarked from prague school structuralism to present day applications in linguistic theory and cultural analysis using the reference point of english grammar and sound structure the author focuses on the fundamental asymmetry between terms of linguistic relationships in which one term is more broadly defined and hence dominant the unmarked term while the other is more narrowly defined the marked term in addition to examining language particular markedness relations evident in the structure and history of english battistella raises questions concerning universal asymmetries as well he discusses the status of markedness as a unifying concept of linguistic structure and as a principle of language change

this handbook represents the development of research and the current level of knowledge in the fields of syntactic theory and syntax analysis syntax can look back to a long tradition especially in the last 50 years however the interaction between syntactic theory and syntactic analysis has led to a rapid increase in analyses and theoretical suggestions this second edition of the handbook on syntax adopts a unifying perspective and therefore does not place the division of syntactic theory into several schools to the fore but the increase in knowledge resulting from the fruitful argumentations between syntactic analysis and syntactic theory it uses selected phenomena of individual languages and their cross linguistic realizations to explain what syntactic analyses can do and at the same time to show in what respects syntactic theories differ from each other it investigates how syntax is related to neighbouring disciplines and investigate the role of the interfaces especially the relationship between syntax and phonology morphology compositional semantics pragmatics and the lexicon the phenomena chosen bring together renowned experts in syntax and represent the consensus reached as to what has to be considered as an important as well as illustrative syntactic phenomenon the phenomena discuss do not only serve to show syntactic analyses but also to compare theoretical approaches with each other

theories of language espoused by linguists during much of this century have assumed that there is a hierarchy to the elements of language such that certain constructions rules and features are unmarked while others are marked happy for example is unmarked or neutral while unhappy is marked this opposition referred to as markedness is one of the concepts which both chomskyan generative grammar and jakobsonian structuralism appear to share yet which each tradition has treated differently edwin battistella studies the historical development of the concept of markedness in the prague school structuralism of roman jakobson its importation into

generative linguistics and its subsequent development within chomsky s principles and parameters framework he traces how structuralist and generative linguistics have drawn on and expanded the notion of markedness both as a means of characterizing linguistic constructs and as a theory of the innate language faculty rather than proposing a new theory of markedness the logic of markedness studies the evolution of the concept and its treatment in two different but related linguistic frameworks and as such will appeal to many linguists interested in markedness in jakobsonian and chomskyan theories of grammar and in language acquisition

Decoding the Conversion: g/cc to kg/m³

The seemingly simple task of converting grams per cubic centimeter (g/cc) to kilograms per cubic meter (kg/m³) often trips up students and professionals alike. This isn't a complex mathematical operation, but a thorough understanding of the underlying units and the logic behind the conversion is crucial for accuracy and preventing errors in various scientific and engineering applications. This article will provide a clear, step-by-step guide to mastering this conversion, incorporating real-world examples to illustrate its practical significance.

Understanding the Units: g/cc and kg/m³

Before diving into the conversion process, it's essential to grasp the individual units involved. `g/cc` (grams per cubic centimeter) is a unit of density, representing the mass of a substance contained within one cubic centimeter of volume. Similarly, `kg/m³` (kilograms per cubic meter) also represents density but uses larger units of mass (kilograms) and volume (cubic meters). Understanding this fundamental difference is the cornerstone of the conversion. The cubic centimeter (cc or cm³) is a unit of volume representing a cube with sides of 1 centimeter each. The cubic meter (m³) is a significantly larger volume, representing a cube with sides of 1 meter each. Since 1 meter equals 100 centimeters, 1 m³ is equivalent to $(100 \text{ cm})^3 = 1{,}000{,}000 \text{ cm}^3$. This substantial difference in volume is key to understanding the magnitude of the conversion factor. The kilogram (kg) is the standard unit of mass in the metric system, and it is equal to 1000 grams (g). This difference in mass units further contributes to the conversion factor.

The Conversion Process: A Step-by-Step Guide

Converting g/cc to kg/m³ requires a two-step process: Step 1: Convert grams to kilograms. Since 1 kg = 1000 g, we divide the value in grams by 1000 to obtain the equivalent value in kilograms. For example, if we have a density of 2 g/cc, we convert the grams to kilograms as follows: 2 g / 1000 g/kg = 0.002 kg Step 2: Convert cubic centimeters to cubic meters. As established earlier, 1 m³ = 1,000,000 cm³. Therefore, we need to multiply the value in cubic centimeters by

1,000,000 to get the equivalent value in cubic meters. However, in our density conversion, we are converting the denominator, therefore we must divide by 1,000,000. Using our example: 1 cc / 1,000,000 cc/m³ = 0.000001 m³ Combining the Steps: To complete the conversion, we combine both steps. We take the kilograms obtained in Step 1 and divide it by the cubic meters obtained in Step 2: 0.002 kg / 0.000001 m³ = 2000 kg/m³ Therefore, a density of 2 g/cc is equivalent to 2000 kg/m³. This shows that the conversion factor from g/cc to kg/m³ is 1000. A simpler way to perform the conversion is to multiply the value in g/cc by 1000.

Real-World Applications

The conversion from g/cc to kg/m³ is vital in various fields: Material Science: Determining the density of materials is crucial in engineering design. Converting units ensures consistency and compatibility with different engineering software and standards. For example, designing a bridge requires knowing the density of concrete in kg/m³ to calculate its mass and structural integrity. Chemical Engineering: Many chemical processes rely on accurate density measurements. Converting from g/cc to kg/m³ ensures compatibility with larger-scale industrial processes. The production of polymers, for example, relies heavily on accurate density calculations for optimal mixing and reaction control. Environmental Science: Measuring the density of pollutants in water or soil often requires unit conversions. Accurate measurements are crucial for environmental monitoring and remediation efforts.

Conclusion

Converting g/cc to kg/m³ involves a straightforward two-step process, fundamentally a multiplication by 1000. This conversion is vital for maintaining consistency and accuracy in scientific and engineering calculations across various disciplines. Understanding the underlying principles of unit conversion and the relationships between grams, kilograms, cubic centimeters, and cubic meters is key to accurate results and avoiding common errors.

FAQs

1. Why is the conversion factor 1000? The conversion factor arises from the relationship between grams and kilograms (1000 g = 1 kg) and cubic centimeters and cubic meters (1,000,000 cm³ = 1 m³). These factors combine to give a simple multiplication by 1000. 2. Can I use a calculator for this conversion? Yes, a simple calculator can be

used, either by performing the two-step process separately or by directly multiplying the g/cc value by 1000. 3. What if I have a density in g/ml? Since 1 ml (milliliter) is equal to 1 cm³, the conversion from g/ml to kg/m³ is identical to the conversion from g/cc to kg/m³. 4. Are there any situations where this conversion might be inaccurate? The conversion is precise as long as the initial density measurement is accurate. Errors can arise from inaccurate measurement techniques or inconsistencies in the material's density. 5. What are some common mistakes to avoid? Common mistakes include forgetting to account for both the mass and volume conversions, or incorrectly applying the conversion factor (e.g., dividing instead of multiplying, or vice versa). Always double-check your calculations to avoid these errors.
